YOUR HVAC SPRING TO-DO LIST

change this spring. Add this to the top of your to do list for the season, and you'll reap the benefits for the years added to your equipment's lifespan. Even though we're moving out of "furnace season," this is a great time to address any possible issues your furnace may have developed from keeping you warm all winter. Tuning up your air conditioner during this colder season will also prepare you for the sweltering heat before it becomes a problem.

Don't ignore your ventilation

Ventilation is critical regardless of the season. If you have allergies that act up in the spring, it may be tempting to shut all the windows and recirculate air to avoid outdoor allergens. That's not the solution. A robust ventilation system gives you the benefit of outdoor air without exposure to allergens from outside. Ensure that your exhaust systems work, and consider a heat recovery ventilation system with high efficiency filters to get the benefit of outdoor air without the allergens.

Turn down your thermostat

As the temperature outside rises, don't forget to adjust your thermostat. Save energy and maintain your indoor comfort levels. If you have a programmable thermostat, lower your setpoints as the weather improves, or do it manually as needed.

If you need help with any of these to-do items, give Gary & Sons Inc. a call and we can help you get the most out of your HVAC system this spring.

Why a to-do list?

When it comes to your heating, ventilation and air-conditioning, or HVAC, system, avoiding certain behaviors and ensuring you don't neglect proper maintenance is critical to keeping your system functioning. Winter might be fading away, but spring and summer have their own challenges. Not to mention indoor air quality is important year-round.

To protect your family's health and to keep your HVAC system in top shape, here is your spring to-do list.

Change the dirty filter

A dirty filter is telling you its time to replace it. Neglecting your filter leads to dust in your ductwork, increased allergen levels and a struggling blower. Replace your filter this spring to avoid poor indoor air quality and the issues that come with it.

Spring clean your furnace area

If your furnace area also functions as storage space, this is a definite chore. This spring, add the furnace room to your spring clean-up list so your equipment has the right amount of clearance for safe and efficient operation.

Don't neglect a tune up

Neglecting your HVAC equipment is another habit to
